The LWPS is a modular, portable and scalable reverse osmosis water purification system that can achieve absolute water purification in any field condition. It was developed for use by highly mobile teams in remote areas or emergency and temporary sites. The system's versatility provides for self-contained, water purification, storage and distribution without the need for external power or HME. The LWPS is able to provide sustainable water purification support in expeditionary environments.

The LWPS has an easy access, open frame design and all connections are quick-release for easy maintenance and quick element or parts replacement. It is ALL SOURCE CAPABLE™, able to purify fresh, brackish and sea water, even water contaminated with nuclear, chemical and biological (NBC) agents.

ENHANCED PRODUCTION MODULE Operating Configuration Schematic

The LWPS EPM, (Lightweight Water Purification System - Enhanced Production Module), is the fifth extended capability module which can be added to the system to produce twice the water production with a significant fuel reduction.

Because of the LWPS' unique flow and true scalability, production is doubled by adding a second set of high pressure pump and RO modules to the base system. A maximum total production of 600 GPH/10 GPM can be achieved while the total operational footprint is increased by only a few feet.

Purify water anywhere in the world from any source.
